```

Tedious to enter the rhythm for each note.

Our contribution

- A language called *abcd* closer to a real graphical score
  $\rightarrow$ Musical language like *Markdown*

- Easy to read
  $\rightarrow$ Rhythm is only *partially specified*

`https://github.com/francoisschwarzentruber/abcd`

demo

Outline

Problem definition

```
4/4 a.       b |
```

Definition (Rhythm inference)

- input:
  - approximative durations $\hat{\delta}_1, \ldots, \hat{\delta}_n \in \mathbb{R}^+$, $\hat{\delta}_1 = 5,\ \hat{\delta}_2 = 1$
  - finite domains $\Delta_1, \ldots, \Delta_n \subseteq \mathbb{R}$,

    $\Delta_1 = \{3/2, 3/4, 3/8, 3/16, 3/32, 3/64\}$

    $\Delta_2 = \{1, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64\}$
  - duration T of a measure; $T = 1$
- output: inferred durations $\delta_1, \ldots, \delta_n$ that form a solution of...
  a the mathematical program we are going to define!

  $\delta_1 = 3/4,\ \delta_2 = 1/4$

Outline

Consistency

$$\delta_i \in \Delta_i \text{ for all } i = 1..n \tag{1}$$

$$\sum_{i=1}^{n} \delta_i = T \tag{2}$$

Taking the approximate durations into account

$$\begin{array}{l} \text{minimize } \sum_{i,j=1}^{n} err_{ij} \\ \left\{ \begin{array}{l} \delta_i \in \Delta_i \text{ for all } i = 1..n \\ \sum_{i=1}^{n} \delta_i = T \\ \delta_j - \delta_i \leq err_{ij} \text{ if } \hat{\delta}_i \geq \hat{\delta}_j \\ err_{ij} \geq 0 \end{array} \right. \end{array}$$

Technical trick

It is then transformed into a Mixed-Integer linear program by:

- introducing variables $x_{id} = 1$ for all $i = 1..n$, for all $d \in \Delta_i$
- adding the constraint $\sum_{d \in \Delta_i} x_{id} = 1$: δ_i takes a unique value
- replacing each occurrence of δ_i by $\sum_{d \in \Delta_i} d \times x_{id}$.

Outline

Future work: modeling

- Improving the inference

  $\rightarrow$ Improving the model

- Take the existing score into account

  $\rightarrow$ Automatically take a previous rhythm in the score

Future work: algorithmic questions

- Some input, e.g. `4/4 a b c |` may have several solutions
  → Minimize the number of rhythm indication to add for having a unique solution

- Some input, e.g. `4/4 a4 b4 c2 |` are over specified
  → Remove a maximum number of rhythm indication to still have this very unique solution

- Need for real-time, need for an efficient algorithm
  → Study theoretical complexity? Design efficient algorithms?

Future work: development

- Improve the tool
- Integrate this feature in Musescore and/or Lilypond and/or ABC?

Other ideas

- Link with type inference in programming language?
- Preferences? Default reasoning?
- Data mining to the most frequent rhythms?

- Thanks to Charlotte Truchet
- Thanks in advance to the potential group of students working on that project

and

Thank you!
